## Waste Management

**We're excited to announce a change in the reporting process for non-collection of waste cans. The drivers for Waste Management will begin posting a Notice of Non-Collection directly on any can they are unable to service. This bright yellow notice will indicate the specific reason for non-collection. Further details will be emailed.**

## Maintenance Tip Did you know?

In the summer, ceiling fans should rotate counterclockwise to push cool air down to the floor. The cool air evaporates perspiration and creates a wind chill effect, which makes you feel cooler without affecting the room temperature. This allows you to set the thermostat at a higher temperature without forfeiting comfort.

So, how can you tell if your ceiling fan direction is set for summer? Turn on the fan, stand directly under the fan blades and watch the blades rotate. The blades should move from the top left, then down to the right, and then back to the top. Looking for a more telltale sign? You should feel air movement while standing under the fan. If you do not feel air movement, the fan is spinning clockwise.
